

# Climate Change Narrative Game Education

Allan Feldman\*, Glenn Smith\*, Yiping Lou\*, Ping Wang##, University of South Florida, Tampa, Florida, \*: College of Education, ##: School of Geosciences  
Paul Siegel, Stony Brook University, Stony Brook, New York

**Climate Change Narrative Game Education** (CHANGE) was recently funded by NSF (DRL-1316782). CHANGE's goal is to help high school students learn complex GCC science by making it personally relevant and understandable. CHANGE is creating a prototype curriculum that will be integrated into elective Marine Sciences high school courses, and test its efficacy.

## CHANGE Principles

CHANGE uses:

- scientifically **realistic text narratives** about future Florida residents (text stories with local Florida characters, 50-100 years in the future based on GCC),
- a **local, place-based approach** grounded in west-central Florida Gulf Coast scientific data,
- a focus on **the built environment**,
- simulations & games **based on scientific data** to help students learn principles of GCC so students can experience and try to cope with potential long term effect of GCC via role-play and science-based simulation, and
- a **web-based "intermedia" eBook narrative** where sections of narrative text alternate with simulations/computer games.

## Impact on high school climate change education

- The use of a **future narratives** approach, relating to local issues, and the focus on the **built environment** will help students attach a "human face" and a sense of immediacy to hitherto abstract issues of global warming.
- The **gaming space** taps into high school students' love of computer games by providing a highly engaging approach to climate change education.
- The **collaborative** nature of the game taps into adolescents' peer-based identities to help actively engage them in climate change science.
- Accurate **science visualizations** based on real **data** provide an easy and accurate way to understand complex and authentic scientific phenomena.
- Integration of the narrative and gaming system into the Marine Science course** provides accessible talking points to directly segue from stories students identify with into hard science content.
- The **use of text narratives along with computer games** provides an economical way to extend the system.
- The model, with its focus on local, place-based issues can be **easily and economically propagated to other locales around the country**, by substituting in local settings, issues, and data.

## CHANGE will be integrated into the FL Marine Sciences course

## CHANGE Learning Objectives:

- Demonstrate a fundamental and working understanding of climate change and climate change science especially as it relates to the built environment. Understand a list of prioritized key factors influencing global climate and their relationship.
- Demonstrate a fundamental and working understanding of the interrelation among the natural environment, built environment, social aspects in the context of climate change in coastal regions. Develop a list of interactive factors on how a specific environment, e.g., a coastal barrier island, functions.
- Effectively communicate about climate change and climate change science.
- Engage in informed and responsible decision making related to climate change at local scale in the context of the entire globe as a whole.

## CHANGE Research Hypotheses:

**Hypothesis 1:** A **framing narrative** approach to climate change education will help high school students understand climate change science in a more coherent way.

**Hypothesis 2:** A **local, place-based** educational approach will make climate change science more relevant and accessible for high school students.

**Hypothesis 3:** A **local, place-based** educational approach, focusing on the **built environment**, will make learning climate change science more relevant and accessible to high school students.

**Hypothesis 4:** An **intermedia text narrative, gaming and simulation space**, concluding with **role-play** and **students writing endings to the story**, will stimulate and engage students to apply the newly acquired knowledge (and pre-existing knowledge) in problem solving, and will boost continuing engagement in science, potential desire for science career paths, and result in more content learned.

## CHANGE Research Questions:

How do (H1) **framing narratives**, (H2) **a local, place-based approach**, (H3) **a focus on the built environment** and (H4) **an intermedia text narrative, gaming and simulation space**, affect students' learning and teachers' instruction of climate change science?" More specifically, we ask how does CHANGE affect:

- students' learning of climate change science?
- students' interest in climate change science? and
- teachers' instruction of climate change science?

## Data Sources

Research Question	Computer data logs & student work (throughout year)	Student year end exams & unit tests	Student science & climate attitudes surveys (pre- and post)	Classroom observations (4 times in a sample of 5 classes)	Teacher surveys (end year)	Teacher interviews (mid and end year)
1. Student learning	X	X		X		X
2. Student attitudes	X		X	X		X
3. Instruction				X	X	X
