

a child's perspective on climate change and sea level rise

a pictorial presentation of models, pictures and words created by children ages 6-15 from the 2013 SCALE and AIM summer camps reveal how our next generation considers sea level rise and climate change

Surprisingly, It is not a time to be overwhelmed but rather an opportunity to become *leaders* and *prepare* for a better world.

As adults we need to simultaneously share the reality of the present with them while being partners in creating a *transformative* future.

We shine a light on the voices of our future leaders for sustainable cities

SCALE Sustainability Community

Architecture Leadership Education

for children and adults

Drawing Conclusions, architecture firm

AIM Architects in the Making Leadership

Summer camp ages 5 – 17

sustainable cities, future leaders

As urban stakeholders, we design and build scaled models of sustainable, climate resilient cities using all recycled materials.

We explore - where do we live? how do we live? issues of water, energy, waste, food production, transportation and more

(we don't allow cars or gas stations in our cities...)
